Sakala AI: Proof of Concept

Final use-case list · Government of Karnataka · 13 October 2026

Core goal. A citizen files one request or complaint, from any source and in Kannada or English. It is completed, validated and routed straight to the correct department and the **exact field officer for that village / GP**. The system then makes sure that officer acts, escalating automatically, with full accountability and a leadership view.

Source key: **Both** asked by the Chief Secretary and already in our plan **Chief Secretary** new from the Chief Secretary meeting **Ours** from our analysis, the scope document and the client use-case PDF **Production phase** shown in the UI only

A. Intake: getting a complete, clean request in

#	Use case	What it does	Source	Data
1	**AI application-completion agent**	Voice or text, Kannada/English. Keeps asking for missing details and documents until the application is complete, then confirms with the citizen. 3 services: caste/income certificate, old-age pension, ration card.	Chief Secretary	Synthetic data
2	**Photo / scanned application intake**	Upload a form or handwritten petition; AI reads it, extracts the fields and loads them into the database. Unreadable parts flagged for a human.	Both	Synthetic data
3	**Data validation & standardisation**	Live checks at intake (mobile, Aadhaar format, pin code to district, village in master, documents, duplicates) plus a data-quality report on the 9,999 historical rows.	Both	Real data
4	**Privacy shield**	Phone, Aadhaar and ration-card numbers masked before the AI or the screen sees them. Sakala RD/GSC numbers extracted first.	Ours	Real data
5	**Wrong-door detector**	Flags non-grievances (RTI, court/sub-judice, suggestions, employee service matters) and says where they should go.	Ours	Real data

B. Routing: right department, exact officer

#	Use case	What it does	Source	Data
6	**AI understanding**	Complaint/request → Department → Line Department → Service → Grievance type + Sakala tag. Confidence, top-3 alternatives, reason in Kannada & English. Picks only from the official master.	Ours	Real data
7	**Exact-officer routing to village / GP**	Location → named first-level officer (LMF / Designated Officer) → L2 → L3, with a map pin. Jurisdiction master; taluk fallback flagged amber.	Ours	Real data
8	**Misrouting detector + human scrutiny desk**	Flags wrong historical labels (KRIDL 'General' desk, 'General' rows). Low-confidence cases go to a person with the top-3 options.	Ours	Real data
9	**Vulnerability fast-lane**	Elderly, widow, disabled, pension and ration cases prioritised.	Ours	Real data
10	**Accuracy proof**	Held-out test: department, exact-officer and end-to-end accuracy.	Ours	Real data

C. After routing: officer action & accountability

#	Use case	What it does	Source	Data
11	**Automatic three-level escalation**	Sakala applications: legal deadlines (clock starts when complete, holidays excluded), Designated → Competent → Appellate officer. Grievances: configurable deadlines, LMF → L2 → L3. Live 'move time forward' simulation. Synthetic applications calibrated to each district's real 2025 late, rejection and overdue rates.	Both	Synthetic data
12	**Officer reminder board, notices & audit trail**	Each officer's open cases with days open, days left, green/amber/red. Daily digest, pre-escalation warning, notice to senior. AI-drafted Form C / E-4 notices. Full audit log.	Both	Synthetic data
13	**HRMS salary-linked accountability**	Delay → Rs 20/day (max Rs 500) → notice → 7-day reply → Competent Officer approval → debit note posted to a mock HRMS. A human always approves.	Both	Synthetic data
14	**Grievance → Sakala bridge**	Complaints quoting an RD/GSC number linked to the application; AI decides whether Sakala rights apply (delayed certificate vs pension payment issue).	Ours	Synthetic data
15	**ATR Quality Auditor**	Complaint + synthetic Action Taken Report (PDF) → summary, issue-by-issue comparison, 1-5 rating or 'insufficient evidence', re-open flag; officer copilot drafts a better reply.	Ours	Synthetic data

D. Leadership & intelligence

#	Use case	What it does	Source	Data
16	**Leadership dashboard**	Total pending, ageing buckets, department and district status, cases at each escalation level, overdue officers, offices with 7+ defaults. Sakala side uses the real 2025 district performance reports (see #21).	Both	Real data
17	**Praja Seva historical intelligence**	Camp patterns, top issues by taluk, scrutiny bottleneck, vulnerable citizens waiting, repeat complainants (masked), AI-written summary.	Both	Real data
18	**Wednesday Review Pack**	One-pagers for Tahsildar/EO → AC → DC → Chief Secretary in Kannada & English, matching the government's Wednesday review rhythm. Includes the district's Sakala performance and month-on-month change.	Ours	Real data
19	**Hotspot clusters & root cause**	Repeated or similar complaints grouped by place, with an AI-inferred fix.	Ours	Real data
20	**Ask the data**	Plain-language question → chart and one-line answer, across both grievances and Sakala performance data.	Ours	Real data
21	**Sakala District Performance Tracker (NEW)**	Real 2025 monthly reports for 31 districts (35.2M applications): receipts, in-time %, late %, rejection %, overdue, rank on a Karnataka map, month by month. Highlights e.g. Bengaluru Urban holding a third of state overdue, rejection rate rising from ~6% to ~8.5%, overdue down 63% (51,172 → 19,129).	Both	Real data

22	**Early warning & improved district scorecard (NEW)**	Flags districts whose rejection or overdue is rising before they slip. Shows that today's ranking barely separates districts (scores 61-79, driven almost only by in-time %) and proposes a fairer AI-assisted score.	**Ours**	Real data

E. Integration

#	Use case	What it does	Source	Data
23	**Connect departments at every digital level**	API connector (mocked), Excel/CSV upload (real, demonstrated with the Sakala monthly performance reports), paper scan (real, via #2), officer web console for departments with no system.	**Both**	Real data

F. Production-phase screens (shown in the UI, labelled)

#	Use case	What it does	Source	Data
24	**AI callback to citizen**	Kannada voice call after closure: 'Was your problem solved?'	**Production phase**	Front-end only
25	**Namma Seva 5-star rating**	Citizen rates the service; a low rating means the officer must explain.	**Production phase**	Front-end only
26	**Live integrations**	iPGRS, Sakala, Seva Sindhu, real HRMS, CPGRAMS.	**Production phase**	Front-end only
27	**SMS / WhatsApp / email sending**	Reminders and notices actually sent.	**Production phase**	Front-end only
28	**Learning loop & sovereign model**	Officer corrections retrain a government-hosted Kannada model.	**Production phase**	Front-end only
29	**Citizens-as-sensors alerts**	A spike in a topic and taluk raises an early warning to the DC.	**Production phase**	Front-end only

Summary. 9 items wanted by both the Chief Secretary and us · 1 new from the Chief Secretary · 13 from our analysis · 6 production-phase screens.
Skipped for this POC: WhatsApp voice entry (CS-1) and the Meghalaya reference (CS-11).
Real data used: 9,999 iPGRS / Praja Seva grievances (3-9 Oct 2026, masked) and Sakala monthly district performance reports, Jan-Dec 2025 (31 districts + BBMP row).
Open data issues to raise with Sakala: the "RDPR" and "Revenue" report files are identical to the combined all-department file in all 12 months, so we need the real department-wise exports; the BBMP row uses Bengaluru Urban's population, so its per-lakh figures are invalid; district names still use Ramanagara.
Data honesty: every synthetic record and screen carries a visible "Synthetic data" badge; every front-end-only feature carries a "Production phase" badge.
Guardrails: AI picks only from official masters; every decision shows its reason; low confidence goes to a human; personal data masked before AI; Sakala compensation applies only to Sakala applications; the grievance ladder (LMF → L2 → L3) is never mixed with the Sakala appeal ladder (Designated → Competent → Appellate); salary action always needs human approval.
